A New Solar X-Ray Phenomenon

'We know today that Mars is heating up and its polar ice is receding. Other planets and moons in our solar system are probably heating up, too. It may also be that although time jump technology can time jump a planet, it cannot jump something as massive as our Sun. If a time jump were to use exactly 24 hour increments, most people wouldn't notice it happened at all. Its human nature to only pay attention to things we're conditioned to see, and ignore everything else.'
